

Beehive Manual

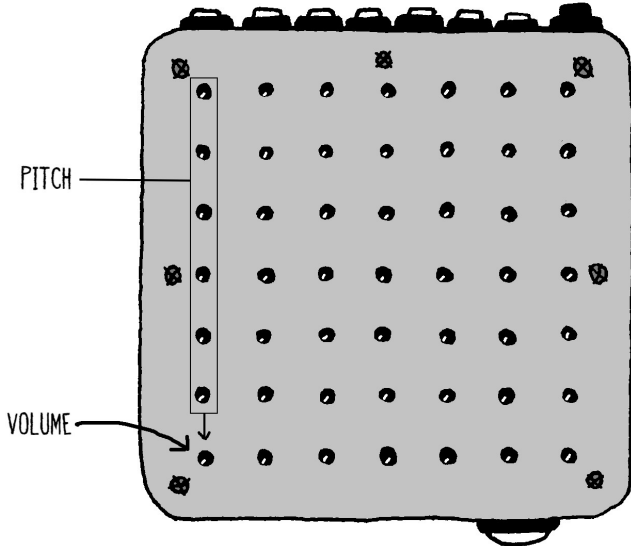

Thank you for supporting Magpie Pedals and getting yourself my first synthesizer!

The Beehive works on a single 9V battery (not included) or 9VDC  center negative.

Controls:

The Beehive has 42 oscillator pitch pots divided into 7 banks (from left to right) with individual volume pots and optional output for each bank.

The 7 bottom pots are the volume pots and they manage 6 oscillators each (above them)

Each bank then goes to its own output which "activates" when you plug in a cable.

If you don't plug in a cable the bank continues to the very left output. This is so you can break out whichever banks you want (to run through effects or panorate if plugged into a mixer) or just go wild and play all 42 oscillators from the same mono output (all the way to the left).
