

Happy Little Accident Manual

Hello.

Thank you for supporting Magpie Pedals and getting yourself one of my effects pedals!

Please feel free to use it with guitar, bass, synths, vocals or anything in between.

The pedal uses 9VDC  center negative power jack (2.1 mm).

There are three controls and a perhaps also a big hole in this pedal:

V - Is your VOLUME control. With a fair amount of boost.

A - Is the ACCIDENT control, all the way to the left you monitor yourself in the real world, all the way to the right you totally lost in the ether. Any mix of those two is possibly.

L - This is your LITTLE help in the ether, it helps you fine tune your experience between the radio waves. This control also screams a lot when you are not playing anything. But Max it completely and it will play out, or tap your finger in the hole to silence it faster.

HOLE - There is, as you've probably noticed, a big happy hole on this pedal. It's there so you can access part of the circuit on the inside. Stick your finger in there and gently touch the circuit to make your pedal go completely bonkers. Together with the **L** knob you now basically have a touch controlled synthesizer. Very avant garde!
