

Stutterphone Manual

Hello.

Thank you for supporting Magpie Pedals and getting yourself one of my effects pedals!

The Stutterphone is built upon one of my oldest DIY ideas: Taking apart an old rotary phone and passing the signal through the original mechanics, using both the number dial and big red button as killswitches. In this version I also added a fuzz!

Please feel free to use it with guitar, bass, synths, vocals, or anything in between.

The pedal uses 9VDC  on a center negative power jack (2.1mm).

Controls:

Footswitch: Effect Bypass.

Big Red Button: This is a classic mechanical killswitch. Meaning it simply cuts the audio signal. It works regardless of the pedal's power state (it's mechanical, so no power needed). Press it to cut the signal.

Number Plate: Use it just like intended for dialing a phone number. Wind it up, and when it's released and rotating back to zero, it will cut the signal on every number it passes. So, if you wind it up to nine it will cut the signal nine times (I think) on its way back. This, together with the big red button, makes it a sort of hands-on mechanical pattern generator. Very tactile and fun!

V - This is your volume control when the pedal is turned on.

X - This is a mix between two different fuzzes. Counterclockwise is a cleaner one, and going clockwise is going gnarly!
